Incremental Optical Encoder with Hollow Through Shaft

RADIO-ENERGIE optical incremental encoders are designed for accurately measuring speed and position of rotating shafts in industrial environment: machine tools, packing machines, motor drives ... They use a differential optical and ratio metric principle to minimize temperature and photodiode aging effects.

Their universal complementary push-pull output interface and their large supply voltage range make them very easy to connect to most of electronic control units with high noise immunity.

Main features

- Shaft type Hollow shaft Ø 42 mm, and others diameters available (20, 25, 30 mm & 1 inch) with reduction ring
- Housing diameter 91 mm
